Life Agent

Installation & Setup Guide

This guide walks you through installing, configuring and running the Life Agent system — from zero to your first morning briefing.

Estimated setup time: 10–15 minutes • Requires Python 3.11+

1. Requirements

Required

- Python 3.11 or higher — python.org/downloads
- An Anthropic API key — console.anthropic.com

The API costs roughly €0.01 per morning briefing. At daily use, expect €0.10–0.20 per month.

Optional

- Whoop device + developer account — for recovery data
- iCloud account — for calendar integration

The system works without both. Recovery sections will show 'No data available' and calendar will show 'No events'. Everything else works.

2. Installation

Step 1 — Unzip the file

Unzip `life-agent-v1.0.zip` to a folder of your choice, for example:

```
C:\Projects\life-agent\ (Windows) ~/Projects/life-agent/ (Mac/Linux)
```

Step 2 — Open a terminal in that folder

Windows: open the folder in Explorer, click the address bar, type `cmd` and press Enter.
Mac/Linux: right-click the folder → Open Terminal.

Step 3 — Install dependencies

```
pip install -r requirements.txt
```

Step 4 — Create your .env file

Rename `.env.example` to `.env` and open it in any text editor.

```
# Minimum required: ANTHROPIC_API_KEY=sk-ant-api03-... # Optional — iCloud calendar: ICLOUD_USERNAME=your@icloud.com ICLOUD_APP_PASSWORD=xxxx-xxxx-xxxx-xxxx # Optional — Whoop: WHOOP_CLIENT_ID=your-client-id WHOOP_CLIENT_SECRET=your-client-secret
```

Get your Anthropic key at console.anthropic.com → API Keys → Create key.

3. Configuration

Calendar name

Open `config.py` and set `CALENDAR_NAME` to the exact name of your iCloud calendar (case-sensitive). Or set it in your .env file:

```
CALENDAR_NAME=My Calendar
```

Your goals

Copy the example file and edit it, or use the interactive coach:

```
# Option A — edit manually: cp data/goals_example.json data/goals.json # Option B — interactive setup: python goals_coach.py chat
```

Your portfolio (optional)

```
cp data/portfolio_example.json data/portfolio.json # Then edit portfolio.json with your own holdings
```

4. Optional — Whoop & iCloud

Connecting Whoop

1. Go to developer.whoop.com and create an app.
2. Copy your Client ID and Secret into `.env`.
3. Run the login command — a browser window opens for OAuth:

```
python cli.py whoop-login
```

Your token is saved locally and refreshes automatically. You only need to do this once.

Connecting iCloud Calendar

1. Go to appleid.apple.com → Security → App-Specific Passwords → Generate.
2. Add your iCloud email and that password to `.env`.
3. Check which calendars are available:

```
python cli.py agendas
```

Copy the exact calendar name into `config.py` or your .env file.

5. Running the System

First run — test everything

```
python morning_briefing.py
```

You should see a morning briefing in your terminal with Whoop data (if connected), today's calendar events, your goals and 3 AI-generated focus points.

Daily commands

Command	What it does
`python morning_briefing.py`	Morning overview — recovery, agenda, goals, focus
`python avond_checkin.py`	Evening check-in — wins, blockers, tomorrow's commitment
`python weekly_review.py`	Full week analysis with AI insights
`python goals_coach.py chat`	Chat with your AI goals coach
`python journal_agent.py schrijven`	Write a journal entry with AI follow-up
`python board.py "question"`	Ask all 6 agents and get a consensus answer

`python financieel_agent.py projectie`	Portfolio projection to your target

Run automatically every day

To run the full schedule automatically (briefing at 07:00, check-in at 21:00, review on Sundays):

```
python scheduler.py
```

Add this to your startup apps or Windows Task Scheduler so it runs in the background.

6. Troubleshooting

API key error

Make sure .env is in the same folder as the scripts and your key has no leading/trailing spaces.

iCloud timeout

iCloud CalDAV can be slow. Try again — it usually connects on the second attempt. Check that your app-specific password is correct (not your main iCloud password).

No Whoop data

If the live API shows no data, the current cycle may still be open. Place your Whoop CSV exports in the data/ folder as a fallback.

Module not found

Run pip install -r requirements.txt again. Make sure you're using Python 3.11+: python --version

Calendar not found

Run python cli.py agendas to see the exact names of your calendars. Copy the name exactly (case-sensitive) into config.py.

Still stuck? Open an issue on GitHub or reach out directly. This system is used daily — bugs get fixed fast.
